Citric acid is a weak organic acid that has the molecular formula $C_6H_8O_7$.

It occurs

naturally in citrus fruits. In biochemistry, it is an intermediate in the citric acid cycle, which occurs in the metabolism of all aerobic organisms. More than two million tons of citric acid are

manufactured every year. It is used widely as an acidifier, as a flavoring and a chelating agent. A citrate is a derivative of citric acid; that is, the salts, esters, and the polyatomic anion found in

On the basis of these in vitro experiments and according to our previous reports on biomimetic citrated-covered apatites , we can postulate

that citrate may both stabilize the amorphous precursor and provide it with negatively-charged surface, facilitating the electrostatic interaction with specific positively-charged groups of collagen

fibrils. As a matter of fact, a similar control through the same mechanism has been proposed for NCPs.
